

PRIVILEGED REMOTE ACCESS + TENABLE.OT

Threat Detection, Vulnerability Management and Secure Remote Access

Vulnerability Management & Analytics

Get a risk-based view of your IT/OT infrastructure, security, and compliance posture to identify and prioritize vulnerabilities

Secure Remote Access

Enable safe remote access to critical OT environments and industrial networks – without a VPN

Proactive Threat Detection

Simulate potential attack vectors to identify weak spots and minimize access to outside networks

Avoid Downtime by Protecting Your OT Environment

BeyondTrust and Tenable enable all organizations to close their cybersecurity exposure gap with continuous threat detection, vulnerability management and highly secure remote access for IT, OT, cloud, container, mobile, apps and more.

Features & Capabilities

Visibility

Gain unparalleled visibility into the modern attack surface with cloud, container, infrastructure OT and web-app sensors.

No VPN

Enable secure remote employee and supplier access to your network without a VPN connection and without connecting directly to your highest-value internal systems. Eliminate the security risks, use case limitations, blind spots, and high expenses imposed by legacy VPN technologies.

Granular Access

Eliminate “all or nothing” remote access for privileged employees and third-party by applying granular, role-based access to specific systems and defined session parameters. Allow vendors or internal users access to specific OT systems, for a specific allotted time, for specific applications or purposes.

Complete Situational Awareness

“De-silo” your IT and OT security efforts by having a complete view of the network, all the devices and their behaviors down to the ladder logic. Examine and verify communication paths.

Disruption of Attack Paths

Protect your industrial network from advanced cyber threats, risks and vulnerabilities posed by hackers and malicious insiders.

Control Of Your Converged Attack Surface

Take full control of your operations network by tracking all changes to any Industrial Control System (ICS) device.

Dynamic Activity Audit & Reporting

Gain complete visibility and control of privileged remote access with extensive reporting that answers these questions: Is the access being used appropriately? When? By whom? For how long?

Protect your OT infrastructure from cyber threats, malicious insiders, and human error.

Tenable addresses the lack of visibility into infrastructures and helps organizations make predictive risk-based decisions on where they should be focusing to reduce the probability of a business impacting cyber event from occurring.

Privileged Remote Access empowers OT teams to control, manage, and audit remote privileged access by authorized employees, suppliers, and vendors, without compromising safety or security and the need for a VPN.

Together, these solutions enable organizations to close their cybersecurity exposure gap.
