

# Identity Security Insights with Password Safe

Protect paths to privilege by locking down credentials and uncovering shadow admin threats

## Overview

Many organizations seek Privileged Access Management (PAM) solutions to satisfy audit or cyber insurance mandates, yet remain unclear about their specific needs and identity and access vulnerabilities.

BeyondTrust Identity Security Insights, the core of the BeyondTrust Platform, uncovers accounts with risky privileges and paths to privilege across the identity landscape, reducing blind spots across endpoints, servers, databases, identity providers (IdP), SaaS solutions, and clouds. Integrating Identity Security Insights with BeyondTrust Password Safe helps organizations bring unmanaged accounts under PAM controls, mitigate privilege risks, and reinforce overall identity security posture.

## Key outcomes

### Gain holistic visibility into identity security posture

Identity Security Insights continuously assesses your entire environment, uncovering accounts with True Privileges and both direct and hidden paths to privilege requiring control. It also monitors your Password Safe infrastructure, tracking changes and mapping attack paths targeting sensitive secrets and credentials. It helps you prioritize actions based on impact.

### Mitigate privilege risks

Identify and mitigate risks like dormant service accounts with unrotated credentials, accounts with Domain Access paths, and shadow admins with unauthorized admin-level privileges. Proactively reduce risks with precise recommendations, detections, and integrated PAM via Password Safe.

### Streamline PAM by eliminating manual data collection and analysis

Make informed decisions by considering the effective privileges of human and non-human accounts, the strength of the posture controls, and whether an account is a prime target of attack. Take proactive measures to manage accounts and eliminate unauthorized access, ensuring credential management and JIT controls through Password Safe.
