

# BeyondTrust and Ping Identity: Unified Identity Security

**Unify identity, access, and privilege into one intelligent security fabric that strengthens resilience and reduces identity-based risks.**

PAM, IAM, and IGA have largely operated in silos — each tackling a piece of identity security, but not integrated into a cohesive identity security strategy. This creates operational inefficiencies, security gaps, and auditing complexity. Organizations need a holistic identity security approach that seamlessly combines identity lifecycle management, SSO, and advanced privileged access management (PAM) that spans foundational and modern use cases.

BeyondTrust + Ping Identity combined solutions provide a unified identity security fabric, enabling a centralized approach for managing, governing, and securing all identities (privileged or non-privileged) and access pathways. Whether granting just enough access for a new employee, revoking privileges at offboarding, closing other gaps in the joiner-mover-leaver process, or detecting and responding to anomalous behavior in real time, this integrated approach continuously ensures proper identity hardening and hygiene.

## Key BeyondTrust + Ping Identity Use Cases

### Govern Conditional Access and Enhance Productivity

Enhance conditional access to applications and data with integrated MFA authentication and just-in-time access.

### Unify Identity Governance & PAM

Reduce risks that may otherwise occur (orphaned accounts, etc.) in the joiner-mover-leaver process.

### Automate Threat Response

Accelerate and simplify incident response workflows for detection and mitigation of threats (i.e. auto-termination of suspicious privileged sessions, etc.) to employee and third-party user accounts / identities.

### Manage and Secure Non-Human Identities (AI Agents)

Gain visibility of AI agents and bring them under IAM and PAM control, including onboarding, offboarding, and governance. Understand the True Privilege™ of identities—including escalation pathways—enforce least privilege and enable JIT approval workflows to prevent unwanted access to sensitive systems and data.

## Benefits of BeyondTrust + Ping

- **Reduce excessive access by up to 91% to shrink the identity attack surface.**
- **Mitigate 75% of Microsoft critical vulnerabilities simply by removing admin rights.**
- **Automate up to 90% of manual access review workloads to accelerate audits and recertification.**
- **Gain extreme scalability with low latency (100M+ identities and 1B+ attributes).**
