

Extend Secure Privileged Access Beyond the Login — From Any User to Any System

From human to machine, control every privileged account and secure every session across hybrid environments.

You already rely on Password Safe to securely store and manage privileged credentials across your IT / OT environments, enforce zero trust, and control who accesses critical accounts.

But when privileged users or third parties need direct access to critical systems like servers, network devices, cloud environments, or industrial control systems, additional layers of control are essential.

This is where Privileged Remote Access (PRA) extends your Password Safe investment by enabling secure, policy-driven access to critical systems. With capabilities like credential injection, just-in-time access, session recording, and secure audit trails, PRA ensures privileged sessions are tightly controlled and fully monitored, eliminating the need for VPNs or shared passwords.

Together, Password Safe and Privileged Remote Access deliver the world's most robust Privileged Account and Session Management (PASM) solution. Users get exactly the access they need, to and from wherever needed, but only for as long as they need it and with complete audit trails.

Key Security Outcomes

Secure Every Privileged Connection

Combine Password Safe credential management with PRA session control to deliver end-to-end security over privileged access. Standardize policies across internal admins and third-party users, while enforcing zero trust principles.

Eliminate Credential Exposure Risks

Privileged Remote Access leverages Password Safe credentials, without ever revealing them to users. No more copy-pasting passwords or sharing accounts across IT, cloud, or OT systems. PRA delivers full accountability by auditing all credentials in every session.

Streamline Access with Just-in-Time Privileges

Automate session approvals, time limits, and role-based policies. Enforce least privilege access and remove standing permissions for critical systems, ensuring users get just-in-time access.

Strengthen Compliance with Centralized Audit Trails

Gain a single source of truth for privileged activity. Capture credentials, sessions, keystrokes, and approvals with centralized audit logs, delivering a single source of truth for compliance.

Client Success Stories

AUTOMOTIVE RETAILER

"Thanks to BeyondTrust's PASM [Privileged Account and Session Management] solution, we now have industry-leading password and access management capabilities. The result is that we can offer support to our national network of franchisees who can meet their clients' needs."

— *Head of Security & IT Operations, Autoleague*

INFORMATION & COMMUNICATION TECHNOLOGY

"In our multi-client, multi-team environment, Privileged Remote Access has allowed us to partition roles, specifying who can access a specific customer account or equipment. It has been very widely implemented: 99% of our customers have adopted it."

— *Service Center Manager and CISO, Axians*
