

Implement Zero Trust Credential Security While Achieving Productivity Gains

Securely managing privileged access and credentials is critical for any organization, particularly those in highly regulated industries.

According to the [Orca 2025 State of Cloud Security Report](#), 89% of organizations have IAM user credentials that haven't been used for 90+ days. The proliferation of digital identities, privileged account sprawl, incomplete visibility across domains, and immature processes are key contributors to credential-based vulnerabilities and risk.

BeyondTrust Password Safe® offers robust capabilities, such as credential rotation, session management, audit trails, and discovery of privileged accounts across diverse environments—from on-premises to cloud and SaaS platforms.

The integration of Password Safe with BeyondTrust Entitle provides further benefits by offering a centralized platform for requesting and managing Just-in-Time (JIT) privileged access, ensuring admins receive the necessary entitlements only for the duration they require.

This powerful offering supports a more intuitive and efficient user experience, while empowering organizations to secure their environments, reduce risk, and maintain compliance—without sacrificing usability or efficiency.

CUSTOMER SUCCESS

FINANCIAL

Billie GmbH

A leading German, cloud-first financial technology company achieved financial compliance and automated access reviews, using Entitle for cloud-native permission management resulting in streamlined processes and reduced risk.

HEALTHCARE

Asklepios

"In the healthcare sector, we are committed to particularly high standards of IT security and data protection. With Password Safe, we can reliably implement all legal IT compliance requirements while simultaneously gaining the necessary cost efficiency, flexibility and productivity in our daily operations."

– Felix Diroll
Head of Server Team

- ✓ **Improve Security Posture by Striving Toward Zero Standing Privileges**
 Through this integration, credentials are not only rotated and kept invisible to the user, but all active permissions are revoked when the user is not logged in. This eliminates standing access and can reduce the attack surface by over 80%.
- ✓ **Benefit from Comprehensive Audit and Compliance Oversight**
 Maintain full audit trails and session recordings to prove the enforcement of Privileged Access Management (PAM) policies and support compliance requirements. Demonstrate least privilege access to customers and auditors by transitioning to a JIT access model.
- ✓ **Reduce Administrative Overhead**
 Leverage a single, unified interface to eliminate the need for multiple tools and interfaces. Simplify privileged access requests to endpoints, servers, databases, cloud environments, and SaaS applications.
- ✓ **Improve User Experience**
 This seamless integration between Password Safe and Entitle enhances user experience by allowing access requests via familiar platforms like MS Teams and Slack. Access to privileged resources is processed up to 40% faster than traditional workflows.
